**Aim:** To implement Restoring division algorithm using c-programming.

**Objective -**

1. To understand the working of Restoring division algorithm.
2. To understand how to implement Restoring division algorithm using c-programming.

**Theory:**

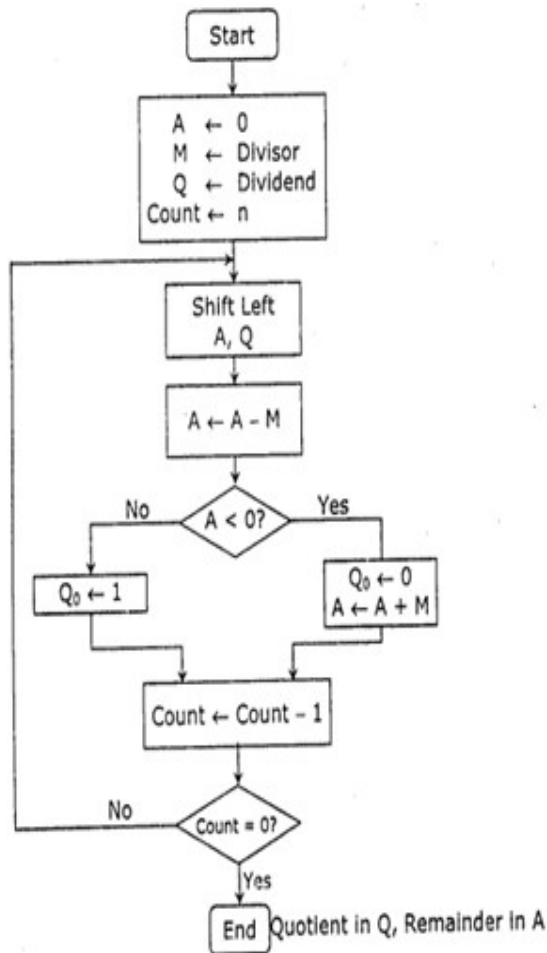

- 1) The divisor is placed in M register, the dividend placed in Q register.
- 2) At every step, the A and Q registers together are shifted to the left by 1-bit
- 3) M is subtracted from A to determine whether A divides the partial remainder. If it does, then Q0 set to 1-bit. Otherwise, Q0 gets a 0 bit and M must be added back to A to restore the previous value.
- 4) The count is then decremented and the process continues for n steps. At the end, the quotient is in the Q register and the remainder is in the A register.

### Output –

Input:

15 7

Output:

Enter the Number :

Quoient: 0010

Remainder: 00001

### Conclusion –

In this experiment, we learned about the division algorithm in computer architecture which is the Restoring Algorithm.
